Single Span 150x50x2.5 RHS Steel RHS C350LO to AS/NZS 1163

Provide 1 mm stiffeneres to steel beams at points of concentrated load and supports

Computations and detificates produced by SpanMan must be submitted to a building surveyor/certifier for approval of the member sizes prior to installation. Installation can only occur when a Building Permit has been granted.

Design Parameters

Country: Australia

Building type: House - domestic dwelling

Design working life: 50 years

Building Type Importance: 2 - Normal structures and structures not falling into

other levels

Roof Use: Normal roof

Roof live load: 0.25 kPa, Roof live load.

Floor Use: General eg living rooms, bedrooms, corridors, kitchen, toilets, study,

rumpus

Floor live load: 1.5 kPa, Floor live load: 1.8 kN

Span = 3.000 mm

A = 3,600 mm (roof span left)

B = 450 mm (roof span right)

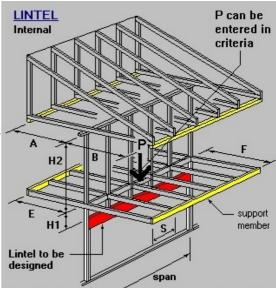

H1 = 0 mm (lower wall height)

H2 = 2,700 mm (upper wall height)

E = 3,600 mm (floor span)

F = 0 mm (floor span right)

S = 600 mm (stud spacing)

Note: for lintels supporting masonry. If H1 is greater than span/2, adopt H1=span/3 and A, B, E and F equal to 0.

Roof weight(0.80 mm steel sheet) = 10 kg/m^2

Roof ceiling(13 mm plaster, pink batt insulation, wiring + sisalation + fittings) 18 kg/m²

Roof self weight(trusses/rafters) = 10.17 kg/m²

CALCULATIONS

Deflections, bending moments, shear forces and support reactions are calculated by the principles of structural analysis and match the output of any standard structural analysis software.

Where deflections, bending moments and spear forces are within 3% of allowable values they are marked in red.

(1) Deflection - Long-Term Dead Load

(+ downward deflection, - upward deflection)

w₁(long-term dead load) = 3.033 kN/m w₁(long-term live load) = 1.08 kN/m

Deflection(1,500 mm from support) = 8.539 mm <= 9.16 2 mm & span/360 ± 10%)

(2) Deflection - Short-Term Point Live Load

(+ downward deflection, - upward deflection)

 $P_{1(live load)}(1.5 \text{ m into span}) = 1.8 \text{ kN}$
