## Fluid Power (Ch 12 p254)

Tuesday, 30 August 2011
6:53 PM

## Continuity:

$\dot{\mathrm{V}}=v \mathrm{~A}$

## Power:

$\mathrm{P}=\dot{\mathrm{m}} g \mathrm{H}$
(Pressure dominant system. e.g. Hydraulics)

$$
\mathrm{P}=\mathrm{p} \dot{\mathrm{~V}}
$$

Full Bernoulli:

Bernoulli Equation: $\mathrm{H}_{1}+\mathrm{H}_{\text {pump }}=\mathrm{H}_{2}+\mathrm{H}_{\text {loses }}$
$\frac{P_{1}}{\rho \mathrm{~g}}+\frac{v_{1}{ }^{2}}{2 \mathrm{~g}}+h_{1}+H=\frac{P_{2}}{\rho \mathrm{~g}}+\frac{v_{2}{ }^{2}}{2 \mathrm{~g}}+h_{2}+H_{\mathrm{L}}$

$$
\frac{\mathrm{p}_{1}}{\rho \mathrm{~g}}+\frac{v_{1}^{2}}{2 \mathrm{~g}}+\mathrm{h}_{1} \pm \mathrm{H}=\frac{\mathrm{p}_{2}}{\rho \mathrm{~g}}+\frac{v_{2}^{2}}{2 \mathrm{~g}}+\mathrm{h}_{2}+\mathrm{H}_{\mathrm{L}}
$$

$$
\mathrm{P}=\dot{\mathrm{m}} \mathrm{gH}
$$

$$
\begin{aligned}
& \mathrm{P}=\text { power }(\mathrm{W}) \\
& \stackrel{\mathrm{m}}{\mathrm{~m}}=\text { mass flow rate }(\mathrm{kg} / \mathrm{s}) \\
& \mathrm{H}=\text { total Head change }\left(\mathrm{H}=\mathrm{H}_{2}-\mathrm{H}_{1}\right)
\end{aligned}
$$

## Simplifications;

Inlet diam = outlet diam (Velocity head unchanged) Inlet height = outlet height (Potential head unchanged) Pressure usually changes!

Hydraulics. Pressure is very high, flowrates not very significant, potential heights negligible.
Watch this...
Hydraulics 20Mpa
$h_{p}=\mathrm{p} / \rho \mathrm{g}$

About 2.5 km high!!
So, this equation
$\mathrm{P}=\dot{\mathrm{m}} \mathrm{gH}$
becomes $\mathrm{P}=\dot{\mathrm{m}} \mathrm{gh}_{\mathrm{p}}=\dot{\mathrm{m}} \mathrm{gp} / \rho \mathrm{g}=\dot{\mathrm{m}} \mathrm{p} / \rho=\mathrm{p} \dot{\mathrm{V}}$
$\mathrm{P}=\mathrm{p} \dot{\mathrm{V}}$

So, to use POWER in Bernoulli equation, you need to convert to HEAD...
$\mathrm{H}=\frac{\mathrm{P}}{\dot{\mathrm{m} g}}$

Efficiency
Tuesday, 13 September 2011
6:23 PM

$\eta=\frac{P_{f}}{P}$
POWER $=p V$

## Example Pump

Example: Hydraulic Pump
Hydraulics: (Pressure dominant)
$\mathrm{P}=\mathrm{p} \dot{\mathrm{V}}$
Convert from Absolute pressure...
$\mathrm{p}=6500-101.3=6398.7 \mathrm{kPa}$
$\dot{\mathrm{V}}=v \mathrm{~A}$
$=2.5 * \mathrm{Pi}^{*} 0.008^{\wedge} 2 / 4$
$=0.00012566 \mathrm{m3} / \mathrm{s}$
$\mathrm{P}=\mathrm{p} \dot{\mathrm{V}}$
$=6398.7 * 1000 * 0.00012566$
$=804.060642 \mathrm{~W}$

Watch this...
Hydraulics 20Mpa
$\mathrm{h}_{\mathrm{p}}=\mathrm{p} / \rho \mathrm{g}$
$=20 \mathrm{e} 6 /(820 * 9.81)$
$=2,486 \mathrm{~m}$
About 2.5 km high!!

$$
\mathrm{P}=\dot{\mathrm{m}} \mathrm{gH}
$$

Oil density $=820 \mathrm{~kg} / \mathrm{m} 3$

$$
\begin{aligned}
\mathrm{m} & =\mathrm{V} \rho=0.00012566 * 820= \\
& =0.1030412 \mathrm{~kg} / \mathrm{s} \\
\mathrm{H} & =\mathrm{hp}+\mathrm{b} \times+\not \subset \\
& =\mathrm{p} / \rho \mathrm{g} \\
& =6398700 /(820 * 9.81) \\
& =795.4427 \mathrm{~m} \\
\mathrm{P} & =\dot{\mathrm{m}} \mathrm{gH} \\
& =0.1030412 * 9.81 * 795.4427 \\
& =804 \mathrm{~W}
\end{aligned}
$$

## Examples continued

Tuesday, 13 September 2011
7:10 PM

Q1: This 9.3 kW pump handles $46 \mathrm{~L} / \mathrm{s}$. (a) Find the increase in head.

$$
\begin{aligned}
\mathrm{P} & =\dot{\mathrm{m} g} \underline{\mathrm{H}} \\
\mathrm{H} & =\mathrm{P} / \mathrm{mg}=9300 /(46 * 9.81)=20.609 \mathrm{~m}
\end{aligned}
$$

Q2: (cont) This 9.3 kW pump handles $46 \mathrm{~L} / \mathrm{s}$. The inlet pressure is -11 kPa . (b) What is outlet pressure?

All in pressure head...
$\mathrm{H} 2=\mathrm{H} 1+\mathrm{hp}=-11000 /(1000 * 9.81)+20.609$

$$
=-1.1213+20.609=\underline{19.4877 \mathrm{~m}}
$$

Outlet pressure: $\mathrm{hp}=\mathrm{p} / \mathrm{\rho g}$ so $\mathrm{p}=\mathrm{hp} * \rho \mathrm{~g}=19.4877 * 1000 * 9.81=191174.337$

## $P_{f}$

Q3: (cont) This 9.3 kW pump handles $46 \mathrm{~L} / \mathrm{s}$. The inlet pressure is -11 kPa . Motor power is 17 kW (c) What is the efficiency (percentage)?

$$
\eta=9.3 / 17=0.5471
$$

Example of efficiency and power equations for conversion from electrical to shaft to fluid power.

## Shaft power

## Example 12.5 (p260)

Tuesday, 13 September 2011

Find the power of the turbine when head loss $=0.6 \mathrm{~m}$ and exit velocity $=3.5 \mathrm{~m} / \mathrm{s}$.

Bernoulli \& Power $\quad H_{1}=H_{2}$

$$
\begin{aligned}
& \frac{p_{1}}{\rho g}+\frac{v_{1}^{2}}{2 g}+h_{1} \pm H=\frac{p_{2}}{\rho g}+\frac{r_{2}^{2}}{2 g}+h_{2}+H_{2} \\
& h_{p}+H=\text { PUMP } \\
& h_{v} \\
& \text { LOSS }
\end{aligned}
$$

Prob in 5260 $H_{1}=H_{2}$
Total Head stays the same unless friction or pump/turbine

$$
\text { (Hi) FIND } H_{2}
$$

$$
\begin{aligned}
\frac{\mathrm{p}_{1}}{\hat{\rho} \mathrm{~g}}+\frac{v_{2}}{2 \mathrm{~g}}+\mathrm{h}_{1}+\underset{\sim}{\mathrm{H}} & =\frac{\mathrm{p} / 2}{\rho \mathrm{~g}}+\frac{\sqrt[v]{2}}{2 \mathrm{~g}}+\mathrm{K}_{\mathrm{s}}+\underset{\mathrm{L}}{\mathrm{H}_{\mathrm{L}}} \\
\mathrm{P} & =\dot{\mathrm{mg}}
\end{aligned}
$$

Find the Power produced for every $1 \mathrm{~m}^{3}$ of water per second.
$\mathrm{h}_{1}=8.4+0.9=9.3 \mathrm{~m}$
$\mathrm{H}_{\mathrm{t}}=$ turbine head ?
$\mathrm{h}_{\mathrm{V} 2}=3.5^{\wedge} 2 /(2 * 9.81)=0.6244 \mathrm{~m}$
$\mathrm{H}_{\mathrm{t}}=0.6244-9.3+0.6=-8.0756 \mathrm{~m}$
Find the power per $\mathrm{m}^{3}$ of water...
Take $1 \mathrm{~m}^{3}$ per second...

$$
\begin{aligned}
\mathrm{P} & =\dot{\mathrm{mgH}} \\
& =1000 * 9.81^{*}-8.0756 \\
& =-79221.636 \mathrm{~W} \\
& =-79.2216 \mathrm{~kW} \text { (fluid power taken by the turbine) }
\end{aligned}
$$

Output power $($ efficiency $=92 \%)$

$$
\eta=\frac{p}{P f}
$$

P out $=79.2216 * 0.92=72.8839 \mathrm{~kW}$ (shaft power)
... Keep going...
This is shaft power, which is...
$\mathrm{P}=\mathrm{T} \omega$
Generator at 95\%,
Electric power $=72.8839 * 0.95=69.2397 \mathrm{~kW}$ (electrical power) $\mathrm{P}=\mathrm{VI}$

## Examples continued

Tuesday, 13 September 2011
7:32 PM

## Continuity:

$\stackrel{\bullet}{\mathrm{V}}=v \mathrm{~A}$
$\dot{\mathrm{m}}=\rho \mathrm{gh}$

## Power:

## $\mathrm{P}=\dot{\mathrm{m}} \mathrm{gH}$

(Pressure dominant system. e.g. Hydraulics)

$$
\mathrm{P}=\mathrm{p} \dot{\mathrm{~V}}
$$

## Full Bernoulli:

Q7: A water-jet cutter produces a jet of 0.4 mm diameter at a speed of $930 \mathrm{~m} / \mathrm{s}$. (oriface diam is much smaller than water inlet tube) (a) What pressure is needed?
$\frac{\mathrm{p}_{1}}{\rho \mathrm{~g}}+\frac{\psi^{2}}{2 \mathrm{~g}}+\mathscr{K}_{1}+\mathrm{K}_{2}=\frac{\mathrm{p}_{z}}{\rho \mathrm{~g}}+\frac{v_{2}^{2}}{2 \mathrm{~g}}+\mathrm{K}_{2}+\mathrm{K}_{\mathrm{E}}$

$$
\frac{\mathrm{p}_{1}}{\rho \mathrm{~g}}+\frac{v_{1}^{2}}{2 \mathrm{~g}}+\mathrm{h}_{1} \pm \mathrm{H}=\frac{\mathrm{p}_{2}}{\rho \mathrm{~g}}+\frac{v_{2}^{2}}{2 \mathrm{~g}}+\mathrm{h}_{2}+\mathrm{H}_{\mathrm{L}}
$$

$$
\mathrm{h}_{\mathrm{v} 2}=930^{\wedge} 2 /\left(2^{*} 9.81\right)=44,083 \mathrm{~m}
$$

$$
\mathrm{p} 1=44083 *(1000 * 9.81)=432454230 \mathrm{~Pa}=432.454230 \mathrm{MPa}
$$

Q8: (cont) A water-jet cutter produces a jet of 0.4 mm diameter at a speed of $930 \mathrm{~m} / \mathrm{s}$. (oriface diam is much smaller than water inlet tube) (b) What is the volume flowrate?

$$
\begin{aligned}
& \dot{\mathrm{V}}=v \mathrm{~A} \\
& \mathrm{~V}=930^{*} \mathrm{Pi}^{*}(0.4 / 1000)^{\wedge} 2 / 4=0.0001168673 \mathrm{~m}^{3} / \mathrm{s} \\
&=0.1168673 \mathrm{~L} / \mathrm{s}
\end{aligned}
$$

Q9: (cont) A water-jet cutter produces a jet of 0.4 mm diameter at a speed of $930 \mathrm{~m} / \mathrm{s}$. (oriface diam is much smaller than water inlet tube) (c) What power is required?

$$
\begin{aligned}
& \mathrm{P}=\mathrm{p} \dot{\mathrm{~V}} \\
& \mathrm{P}=432454230 * 0.0001168673=50540 \mathrm{~W}
\end{aligned}
$$

Q11: A pump transfers water at $41 \mathrm{~L} / \mathrm{s}$ from 120 m to 132 m elevation. Head loss is 2.3 m . Pump effiiciency is $66 \%$. (a) What fluid power is required?

There is no pipe diameter given.
This means we cannot calculate the velocity.
So we must assume a large pipe diameter - hence a negligable velocity head.
$\mathrm{h} 2=132-120=12 \mathrm{~m}$
The pump is doing ALL the work, so the fluid must be starting from ZERO pressure...
$\mathrm{H}=12+2.3=14.3 \mathrm{~m}$
$\mathrm{P}=\dot{\mathrm{m}} \mathrm{gH}$
$=41 * 9.81 * 14.3=5751.603 \mathrm{~W}$ (fluid power)
Pump efficiency is $66 \%$, so the shaft power required:
$5751.603 / 0.66=8714.55 \mathrm{~W}$ (shaft power)
So total efficiency is: $0.66 * 0.66=0.4356 \%$

(a) Find the mass flow rate

Find V (at propellor): V = vA Velocity at propellor $=(21+7) / 2=14 \mathrm{~km} / \mathrm{h}$

$$
\begin{aligned}
& \mathrm{v}=14 / 3.6=3.8889 \mathrm{~m} / \mathrm{s} \\
& \mathrm{~A}=\mathrm{pi} * 5^{\wedge} 2=78.5398 \mathrm{~m}^{2} \\
& \mathrm{~V}=\mathrm{vA}=3.8889 * 78.5398=305.4334 \mathrm{~m}^{3} / \mathrm{s}
\end{aligned}
$$

Convert to $\mathrm{kg} / \mathrm{s}: \rho=1 / 0.85=1.1765 \mathrm{~kg} / \mathrm{m} 3$

$$
\mathrm{m}=\rho \mathrm{V}=305.4334 * 1.1765=359.34 \mathrm{~kg} / \mathrm{s}
$$

(b) Find the change in head across the turbine

$$
\begin{aligned}
& \mathrm{H}=\mathrm{v}_{2}{ }^{2} / 2 \mathrm{~g}-\mathrm{v}_{1}^{2} / 2 \mathrm{~g}=\mathrm{h}_{\mathrm{v} 2}-\mathrm{h}_{\mathrm{v} 1} \\
& \mathrm{~h}_{\mathrm{v} 2}=(7 / 3.6)^{\wedge} 2 /(2 * 9.81)=0.1927 \mathrm{~m} \\
& \mathrm{~h}_{\mathrm{v} 1}=(21 / 3.6)^{\wedge} 2 /(2 * 9.81)=1.7343 \mathrm{~m} \\
& \mathrm{H}=\mathrm{h}_{\mathrm{v} 2}-\mathrm{h}_{\mathrm{v} 1}=0.1927-1.7343=-1.5416 \mathrm{~m}
\end{aligned}
$$

(c) Find power

$$
\begin{aligned}
& \mathrm{P}=\dot{\mathrm{m} g H} \\
& =359.34 * 9.81 *-1.5416=-5434.33 \mathrm{~W}(5.43 \mathrm{~kW})
\end{aligned}
$$

(c) Find electrical power
$5434.33 * 0.45=2445.4485 \mathrm{~W}(2.445 \mathrm{~kW})$

Q22: Fuel ( $\mathrm{RD}=0.77$ ) is pumped at $14 \mathrm{~kg} / \mathrm{s}$ from an open tank at EL1 $=2.6 \mathrm{~m}$ to closed tank at EL2 $=6.2 \mathrm{~m}$ with vapour pressure 104 kPa . Calculate power required (ignoring losses)

$$
\frac{\mathrm{p}_{1}}{p \mathrm{~g}}+\frac{v^{\prime}}{2 \mathrm{~g}}+\frac{\downarrow}{\mathrm{h}_{1}+\mathrm{H}}+\frac{\stackrel{\jmath}{\mathrm{p}_{2}}}{\rho \mathrm{~g}}+\frac{v^{\prime}}{2 \mathrm{~g}}+\mathrm{h}_{2}+\mathrm{H}_{\mathrm{L}}
$$

$$
\begin{aligned}
\mathrm{h}_{\mathrm{p} 2} & =104000 /(0.77 * 1000 * 9.81)=13.7681 \mathrm{~m} \\
\mathrm{H} & =\mathrm{p}_{2} / \mathrm{\rho g}+\mathrm{h}_{2}-\mathrm{h}_{1} \\
& =13.7681+6.2-2.6=17.3681 \mathrm{~m} \\
\mathrm{P} & =\dot{\mathrm{m}} \mathrm{gH} \\
& =14 * 9.81 * 17.3681 \\
& =2385.335 \mathrm{~W}
\end{aligned}
$$

## Pumping System 2

Tuesday, 20 August 2013
6:14 PM

Q26: Flowrate=34L/s, PG1=20kPa, PG2 $=81 \mathrm{kPa}, \mathrm{D} 1=100 \mathrm{~mm}, \mathrm{D} 2=71 \mathrm{~mm}$, $E L 1=3.6 m, E L 2=10.4 m$. (a) Find pump power

Use continuity to get velocities at 1 and $2 \ldots \quad \dot{\mathrm{~V}}=v \mathrm{~A}$

Then...

$$
\frac{\mathrm{p}_{1}}{\rho \mathrm{~g}}+\frac{v_{1}^{2}}{2 \mathrm{~g}}+\mathrm{h}_{1} \pm \mathrm{H}=\frac{\mathrm{p}_{2}}{\rho \mathrm{~g}}+\frac{v_{2}^{2}}{2 \mathrm{~g}}+\mathrm{h}_{2}+\mathrm{H}_{\mathrm{L}}
$$

Then ...

$$
\mathrm{P}=\dot{\mathrm{m}} g \mathrm{H}
$$
