3 Different versions to make the crossbar more stable

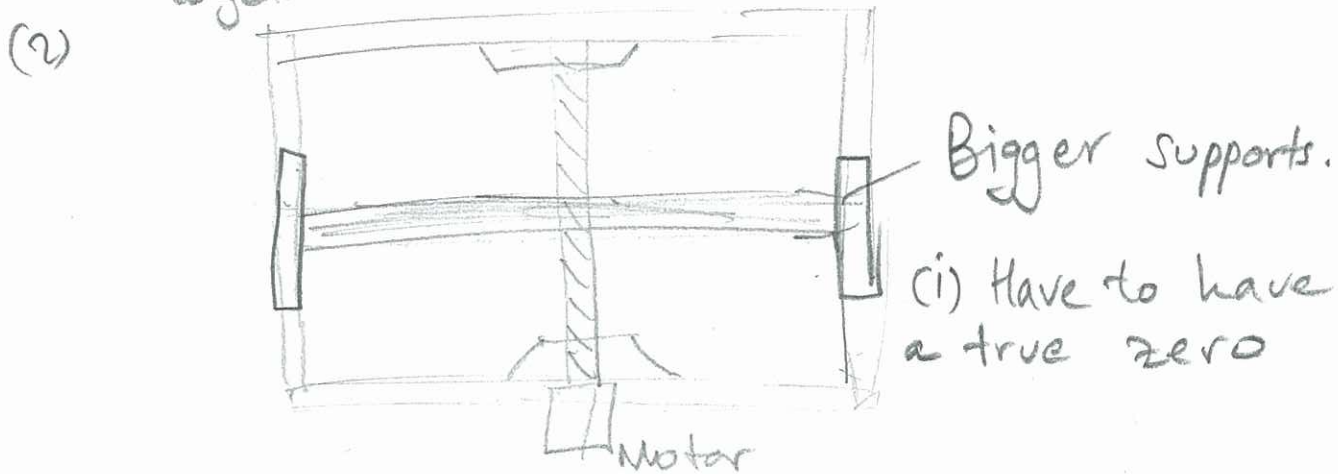

(1) Run two separate motorized screws on either end of the crossbar. This would ensure that it the crossbar would stay true to the job.

(2) Lengthen crossbar slides. By making the slides/guides of the crossbar this would help to keep the bar straight and resist movement.

(3) Run two polished rods on either end of the adjustment screw. This will aid the crossbar slide/guides to keep it level.

(1) Have to get two screws to move together.

(3)

(1) to have a clearance a very small between rods & crossbar.
